## How Augur Works

---

# Introduction

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Augur
  - Trustless, decentralized oracle and prediction market platform
- Decentralized prediction markets
- Centralized prediction markets
  - Global participation
  - Type of market
  - Trust market operator
- Reputation (REP)
  - Market creators
  - Reporters

Augur (REP)

# Life of a Market

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

# Market Creation

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Market creator
  - Sets event end time
  - Chooses designated reporter
  - Chooses resolution source
  - Set creator fee
  - Post bonds:
    - Validity bond: ETH
    - No-show bond: REP
- Invalid market

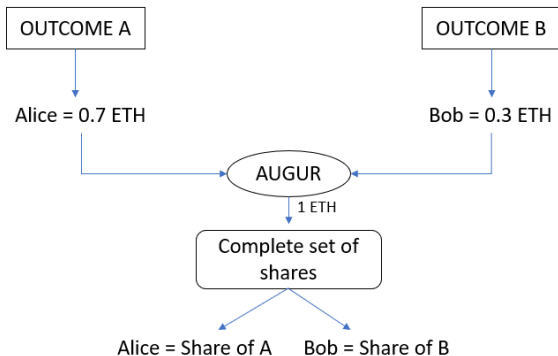

# Trading

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- ☐ Participants trade shares
- ☐ Complete set of shares

# Reporting

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- ☐ Augur's oracle -> Outcomes (Profit motivated reporter)
- ☐ REP owners -> Report and dispute
- ☐ Report = Consensus -> Financial rewards
- ☐ Report != Consensus -> Financially penalized

# Fee Windows

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Augur's reporting system: 7-day long fee window
- Reporting fee pool
- Rewards = REP staked

# Participation tokens

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Participation tokens = 10-18 REP
- End(fee window) = Redeem participation token + proportion of fee pool
- Incentive to monitor platform during a few window (7 days)
- Participation ensures:
  - How to use Augur
  - Aware of forks
  - Participate in forks

# Market state progression

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

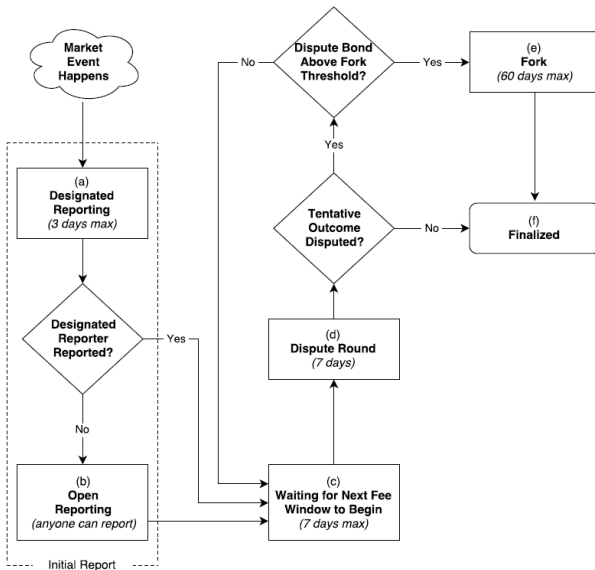

- States of an Augur market:
  - Pre-reporting
  - Designated reporting
  - Open reporting
  - Waiting for the next fee window to begin
  - Dispute round
  - Fork
  - Finalized

# Market state progression

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

# Market state progression

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Pre-reporting:
  - Begin trading -> Pre-reporting -> Market's event occurs
  - Most active period
  - Event end date -> Designated reporting phase
- Designated reporting:
  - Market creators: designated reporter and post no-show bond
  - Failure to report -> Open reporting phase
  - Reporter posts reporter stake on reported outcome
  - If reporter reports -> Waiting for next fee window to begin phase

# Market state progression

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Open reporting:
  - Anyone can report on the outcome
  - Market's first public reporter
    - Receives no-show bond
    - No REP needed to report
  - Open reporting -> Waiting for next fee window to begin phase
- Waiting for next fee window to begin:
  - Reporting is on hold till end of current fee window
  - Next fee window -> Dispute round phase

# Market state progression

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

## □ Dispute round:

- Dispute market's tentative outcome
- Dispute stake
- Successful dispute -> Amount of dispute stake = dispute bond size
- Dispute bond size:

$$B(\omega, n) = 2A_n - 3S(\omega, n)$$

- Ensure ROI of 50% -> successfully dispute false outcomes
- Successful dispute: Another dispute round or fork state
- If(dispute bond > 2.5%(REP)) -> Enter fork state
- Else another dispute round

# Market state progression

## □ Fork:

- 60 days
- Dispute bond > 2.5%(REP) -> forking market
- Fork begins:

- Disputing other markets put on hold
- Fork period > fee window
- Fork final outcome cannot be disputed

- “Yes”/“No” market
- Locked parent universe:
  - No new market
  - Trading shares
  - No reporting rewards
  - Markets cannot be finalized

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

# Market state progression

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

## □ Finalized:

- Pass 7-day dispute round
- Completion of a fork
- Outcome of fork -> final outcome
- Market in finalized state -> final outcome

# Market settlement

- Close position
  - Selling their shares to another trader for currency
  - Settling their shares with the market
- Non-finalized market: Alice and Bob -> complete set
- Finalized market: Alice
- Settlement fee: Settling with market contract
  - Creator fee
  - Reporting fee
- Alice: 70% of fees and Bob: 30% of fees
- Settlement of invalid markets:
  - $N \rightarrow$  possible outcomes
  - $C \text{ ETH} \rightarrow$  Cost of complete set of shares
  - Settlement =  $C/N \text{ ETH}$
- Reputation redistribution

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

## Incentives and Security

---

# Integrity of the Forking Protocol

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

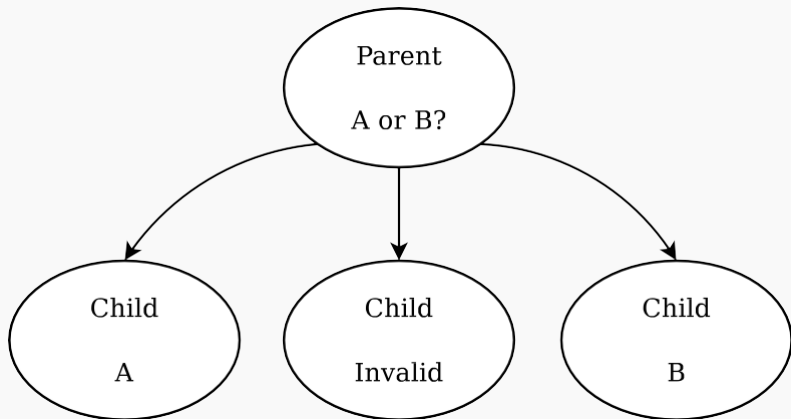

*It is the credible threat of a fork, and the belief that the fork will resolve correctly, that are the cornerstones of Augur's incentive system.*

# Integrity of the Forking Protocol

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

# Integrity of the Forking Protocol

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- ☐ Universe that reflects reality is *true universe*, all others are *false*
- ☐ Universe that receives the majority of REP during forking is *winning universe*, all other universes are *losing universes*
- ☐  $I_a$  – Sum of all escrowed funds in unfinalized markets (*native open interest*)
- ☐  $I_p$  – *Parasitic Open Interest*
- ☐  $P$  – Price of REP
- ☐  $M$  – Total quantity of available REP
- ☐  $S$  – Proportion of  $M$  that will be migrated to *true universe* during forking
- ☐  $SM$  – Quantity of REP migrated to *true universe*
- ☐  $PM$  – Market cap of REP
- ☐  $P_f$  – Price of REP in *false universe*

# Integrity of the Forking Protocol

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

(Market Cap Security Theorem) The forking protocol has integrity if and only if:

1.  $S > \frac{1}{2}$  or
2.  $P_f < P$ , and  $PM > \frac{(I_a + I_p)P}{(P - P_f)S}$

# Assumptions and Consequences

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

☐  $P_f = 0$

☐  $S \geq \frac{1}{5}$

☐  $I_a \geq 2I_p$

☐ Consequences:

$$PM > \frac{(I_a + I_p)P}{(P - P_f)S} \implies PM > \frac{(I_a + \frac{I_a}{2})P}{(P - 0)\frac{1}{5}} \implies PM > \frac{15}{2}I$$

# Assumptions and Consequences

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

☐  $P_f = 0$

☐  $S \geq \frac{1}{5}$

☐  $I_a \geq 2I_p$

☐ Consequences:

$$PM > \frac{(I_a + I_p)P}{(P - P_f)S} \implies PM > \frac{(I_a + \frac{I_a}{2})P}{(P - 0)\frac{1}{5}} \implies PM > \frac{15}{2}I_a$$

REP market cap ( $PM$ ) must be at least 7.5 times the *native open interest* ( $I_a$ )

# Market Cap Nudges

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- ☐ Reporting fee (for window  $i$ ):  $r_i$
- ☐ Target market cap:  $t$
- ☐ Current market cap:  $c$

$$r_i = \max_c \min_{r_{i-1}} \frac{t - \frac{333}{1,000} c}{1 - \frac{1}{10,000} c}$$

# Leveraging the threat of a Fork

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- ☐ Forks are expensive
- ☐ REP is worthless in a *losing* universe
- ☐ Users rewarded with 50% RoI for disputing an outcome

## **Potential Issues and Risks**

---

# Parasitic Markets

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Parasitic Markets
  - Don't pay reporting fees, but resolve in accordance with *native* Augur market
- Jeopardize integrity of oracle
- Make trading cheap to combat parasitic markets

# Volatility of Open Interest

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

# Inconsistent or Malicious Resolution Sources

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- ☐ Attacker is designated reporter and controls the resolution source
- ☐ Market is intentionally misreported
- ☐ Honest reporters see the resolution source differs from the tentative outcome
- ☐ Attacker switches the outcome on the resolution source in the dispute round
- ☐ Market can be held indefinitely in dispute rounds
- ☐ Honest reporters eventually lose
- ☐ **Be wary of dubious reporting sources**

# Self-Referential Resolution Queries

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

*Will any designated reporter fail to submit a report during their three-day forking period before December 31, 2018?*

# Uncertain Fork Participation

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- Can't be sure users will migrate their REP during a fork
- Expect 20% participation
- 5% additional REP as incentive to move during 60 day forking period

# Ambiguous or Subject Markets

[How Augur Works](#)

[Incentives and Security](#)

[Potential Issues and Risks](#)

- ☐ Some questions can't be unilaterally answered
- ☐ Some questions will be debated even after the event occurs
- ☐ Some questions will be structured poorly

*Ensure that markets are clear, unambiguous, and clearly decisive in nature.*
